## ■ Sensitivity Adjustment

Please turn potentiometer VR to set sensitivity as below procedure.

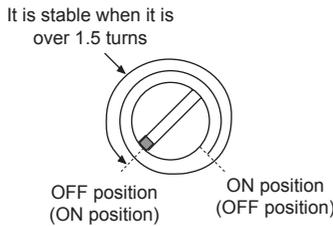

1. Without a sensing object, turn the potentiometer VR to the right and stop at the proximity sensor is ON (OFF).

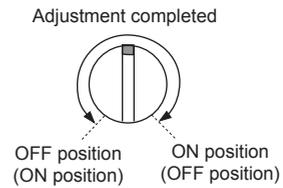

2. Put the object in right sensing position, turn the potentiometer VR to the left and stop at the proximity sensor is OFF (ON).

3. If the difference of the number of potentiometer VR rotation between the ON (OFF) point and the OFF (ON) point is more than 1.5 turns, the sensing operation will be stable.

4. If it is set in sensitivity adjustment position of potentiometer VR at center between 1 and 2, sensitivity setting will be completed.

※When there is distance fluctuation between proximity sensor and the target, please adjust 2 at the farthest distance from this unit.

※Turning potentiometer VR toward clockwise, it will be max., or turning toward counter clockwise, it will be min. The number of adjustment should be  $15 \pm 3$  revolution and if it is turned to the right or left excessively, it will not stop, but it idles without breakdown.

※( ) is for Normally closed type.

## ■ Grounding

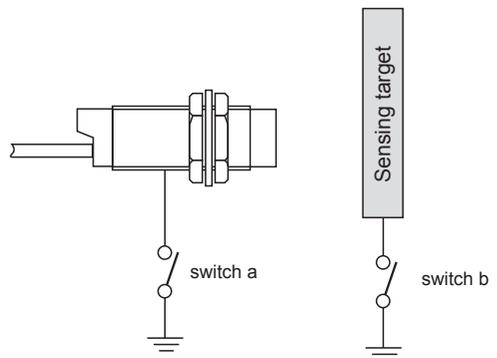

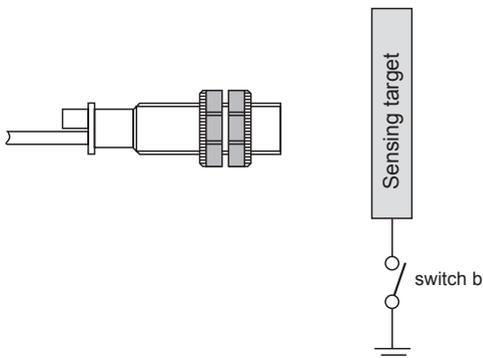

The sensing distance will be changed by grounding status of capacitive proximity sensor and the target[50×50×1mm(Iron)]. Please check the material when installing the sensor and selecting the target.

## ■ Mutual-Interference & Influence by Surrounding Metals

When several proximity sensors are mounted closely, malfunction of sensor may be caused due to mutual interference. Therefore, be sure to keep a minimum distance between the two sensors as below charts.

When sensors are mounted on metallic panel, you must prevent the sensors from malfunction by any metallic object. Therefore, be sure to keep a minimum distance as below charts.

## ■ Materials

### ◎ Materials of sensing targets

Sensing distance may be different by electrical characteristic of sensing target (conductivity, non dielectric constant) and status of water absorption, size etc.

### ◎ Effect by high frequency electrical field

It may cause malfunction by machinery which generate high frequency of electrical field such as a washing machine etc.

### ◎ Surrounding environment

There is water or oil on surface of sensing part, it may cause malfunction.

If the bottle for sensing of level is coated by oil etc., it may cause malfunction.

Especially, 15mm type has high sensitivity for induced objects, please be careful of waterdrops.

### ◎ Organic solvents

Do not let the oil or oil liquid is flowed into the sensor because the case is made by plastic.
